TOXICITY

Can disulfiram (Antabuse) be safely co–administered with the monoamine oxidase inhibitor (MAOI) antidepressants? Despite the ability of the major metabolite of disulfiram (diethyldithiocarbamate) to inhibit the enzyme dopamine beta–hydroxylase and a report of the induction in rats of central motor disturbances, convulsions, and death following the co–administration of tranylcypromine, there appears to be surprisingly little in the literature that directly addresses this question.
